GEOCHEMICAL DATA FROM THE TALLY POND VOLCANIC BELT

P.J.M. Moore, G.C. Squires and H. Rafuse

Open File 012A/1375

**St. John's, Newfoundland
February, 2009**

NOTE

Open File reports and maps issued by the Geological Survey Division of the Newfoundland and Labrador Department of Natural Resources are made available for public use. They have not been formally edited or peer reviewed, and are based upon preliminary data and evaluation.

The purchaser agrees not to provide a digital reproduction or copy of this product to a third party. Derivative products should acknowledge the source of the data.

DISCLAIMER

The Geological Survey, a division of the Department of Natural Resources (the “authors and publishers”), retains the sole right to the original data and information found in any product produced. The authors and publishers assume no legal liability or responsibility for any alterations, changes or misrepresentations made by third parties with respect to these products or the original data. Furthermore, the Geological Survey assumes no liability with respect to digital reproductions or copies of original products or for derivative products made by third parties. Please consult with the Geological Survey in order to ensure originality and correctness of data and/or products.

SUMMARY

This data release consists of whole-rock geochemical data from the Tally Pond volcanic belt and adjacent areas, which represent a volcanogenic massive sulphide environment in central Newfoundland. This area contains the Duck Pond Cu–Zn–Pb–Ag + Au deposit, and numerous other prospects. The geological context of these rocks and a description of the regional stratigraphy are contained in reports by Moore (2003) and Squires and Moore (2004). All of the sampled locations lay within 1:50 000 topographic map sheets 12A/09 and 12A/10. This open file provides no attempt at interpretation of these data; its purpose is to place them in the public domain (Appendix A).

The present release includes locational data, major element and trace element data. All of these samples were acquired in 2002 by Paul Moore or in 2003 by Gerald Squires. The data are tabulated below and are also available in digital format, *i.e.*, Microsoft Excel (*.xls file). The samples include field samples from outcrops and samples collected from diamond drill core.

Note that the release also includes data for several standards, and for analytical blanks completed at Memorial University. These may be used to assess accuracy. Duplicate analyses of selected samples are also included.

Major elements and most trace elements were analyzed at the Department of Natural Resources laboratory by inductively-coupled-plasma–emission-spectrometry (ICP-ES) methods. The trace element Rb was determined by atomic absorption (AA) methods. Rare-earth-element (REE) analysis was carried out at Memorial University of Newfoundland by inductively-coupled-plasma–mass-spectrometry (ICP-MS) methods. Note that a negative value reported for a given element indicates that its concentration was below the detection limit. Major elements are reported in weight percent, and trace elements are reported in ppm.

The drill holes that provided samples for analyses were completed by a variety of exploration companies active in this area. Some of the drill holes are now archived within the Department of Natural Resources Core-Storage Program, but others are in the care of mineral exploration companies. Information on the drill holes and other units encountered are contained in assessment reports. For information on which report should be consulted for a specific drill hole, *see* Table 1. Note that locational data for drillhole samples represents the collar location. In cases where the hole was not drilled vertically, the projected surface location of a given sample may differ from these coordinates.
